Manal rana(bsse23099) -> second interviewer

Laiba Ahmed (bsse23085) -> client

TOPIC: NAB

PROBLEM OVERVIEW:

In the previous assignment we have discussed the problem and the solution now in this interview we will see how that solution in the current website of NAB will be implemented, a thing to remember is that we are not proposing a website we are proposing changes to the existing website to tackle the problems. As, in our problem we see that the website of NAB is allowing the users to ask questions and know more about NAB plus even contact them in case of complaints, now we proposed that the organization should use an integrated system with which the delay in data processing, case management and the un-coordination between various departments will be handled(which was the main problem), that integrated system in short a data base should be connected to the website where the information on the case will be submitted consequently the problem of data retrieval and delay plus the un-coordination will be handled as all the departments will have the same data and synced activities , and the biasness can be reduced by the fact that the website will contain a dashboard showing the roles and the cases of each investigator plus all the info will be secured as each user will be given a specific user identifier. Now, we will see how questions will be asked related to this modification in the existing website.

1. Establishing Customer or User Profile

Questions:

- **What are your key responsibilities? -> R1**
- **How is success measured? -> R2**

Expected Answers:

- "My responsibility is to handle case files, update them according by keeping in contact with the project progress and ensuring secure access to the files."
- "Success is calculated by timely case resolution, accuracy in case information, efficiency in data handling." **2. Assessing the Problem**

Questions:

- **Why does this problem exist? -> R3**

Expected Answers:

- "This problem exists because the current system lacks integration(centralization) between departments, which leads to delay in sharing case information and hinders the coordination."

3. Understanding the User Environment

Questions:

- **Who are the users? -> R4**
- **What is their educational background? -> R5**
- **What is their computer background? -> R6**

Expected Answers:

- **"**The users in this are the investigators, case managers and the employees.
- **"**Most of the users come from legal studies and administration educational background.**"**
- "Users might not be really adept in technology, but they have experience in working with case management software and databases."

4. Recap of Understanding

- **Questions:**

- **Does this adequately represents the problem you are facing with your existing solution? -> R7**

- **Expected Answer:**

- **“**It indeed represents many issues with the existing system, especially with information delays and department coordination. However, some departments feel that the current system’s isolated structure helps them control their specific data needs. Moving to an integrated system might solve one problem but create concerns around data control and potential information overload for teams used to working independently.**”**

5. **The Analyst’s Input on Customer’s Problem Questions:**

   - **What are the reasons for this problem? -> R8**
   - **How do you currently solve the problem? -> R9**

Answers:

- **“**The main problem is the absence of a centralized (integrated) system, which means each department is handling cases with isolated data. This lack of integration causes delays indeed but at the very same time certain departments think that this really is not the ideal solution as they are fine working independently without waiting for updates from other departments and they also prefer working alone.**”**
- **“**The current solution requires each department to manually submit their reports and update the system manually too, which introduces delays in data transfer, retrieval and even cause delay in critical information transfer and at the very same time the un-coordination among the departments arise because of this which makes integration an ideal solution.**”**

6. **Assessing Your Solution (If Possible)**

Question:

- **How would you rank the importance of these? -> R10**

Expected Answer:

- The seamless transfer of data sure is the highest priority, and we hope that the new solution will bring changes that will help in fast and secure data transfer.

7. **Assessing the Opportunity**

Questions:

- **Who in your organization needs this solution? -> R11**

Expected Answers:

- Investigators, case managers, legal managers and the administrators and all other employees working for the organization who use this system often need this solution.

8. Assessing the Reliability, Performance, and Support Needs

Questions:

- **How will the software be distributed? -> R12**

Expected Answer:

- A cloud- based distribution will be ideal for this in case of accessibility.

9. Other Requirements

Questions:

- **Can you think of any other requirement we should know? -> R13**

- **Expected Answer:**

- It would be helpful to have role-specific dashboards, so each department sees only what's relevant to them and also authentication system for verification, so that only the person with specific designated role will access the files that are related to him/her.

10. Wrap Up

Question:

- **If I need to ask you anything will be willing to take part in requirements review? -> R14**

ANSWER:

- Yes, I will willingly take part in the feedback of the requirements.

11. The Analyst's Summary

Summary Statement:

The proposed solution aims to address the coordination, data retrieval delays, and isolated departmental operations within NAB's existing system by integrating a centralized database into the current website infrastructure. This solution would provide real-time, synchronized access to case data across departments, reducing data processing lags and improving collaboration. However, while many users recognize the benefit of seamless data access, some departments are concerned about potential data overload and prefer the autonomy of isolated data management. To mitigate these concerns, we recommend role-specific dashboards and a secure, cloud-based distribution model that will streamline data transfer, maintain relevant access, and protect sensitive information with strict authentication controls. This integrated system is expected to optimize efficiency, support timely updates, and enhance the overall user experience by aligning NAB's goals with secure, reliable access to case information.

REQUIREMENT	R1	R2	R3	R4	R5	R6	R7	R8	R9	R10	R11	R12	R13	R14
