Now we will look at the requirements that are nor overlapping and conflicting and then make this document.

R1(of both): exactly the same that is overlap let us take one out of two as both are same.

R2-> there is a conflict in the R2 of both interviews so we had negotiations with the user and chose to with the R2 of interview two.

R3-> there are conflicts in the R3 of both interviews so after negotiations we chose to go with the R3 of interview1.

R4, R5. R6 are same in both docs (overlapping) let us take one from interview 1 then as in both the requirements are same.

R7 -> There is a conflict in the R7 of both interviews after negotiations we chose to with R7 of interview2.

R8-> there is overlapping between the requirements of both interviews. Lets take one from interview 1 then.

R9-> ok so here is also an overlapping so let us take requirement from interview1.

R10-> there was a conflict in the R10 of both interviews so we chose to go with thw R10 of interview 2 after negotiations.

R11-> overlapping in both interviews so let us take one from interview1.

R12-> overlapping in both interviews so let us take one from interview1.

R13-> Conflict in both interviews so let us take from interview2 after negotiations.

R14-> -> overlapping in both interviews so let us take one from interview2.

REQUIREMENT	R1	R2	R3	R4	R5	R6	R7	R8	R9	R10	R11	R12	R13	R14
R1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R2	0	0	0	0	0	0	0	0	0	1000	0	0	0	0
R3	0	0	0	0	0	0	1000	1000	1	0	0	0	0	0
R4	0	0	0	0	0	0	0	0	0	0	1000	0	0	0
R5	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R6	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R7	0	0	1000	0	0	0	0	1000	1	0	0	0	0	0
R8	0	0	1000	0	0	0	1000	0	1	0	0	0	0	0
R9	0	0	1000	0	0	0	1	1	0	0	0	0	0	0
R10	0	1000	0	0	0	0	0	0	0	0	0	0	0	0
R11	0	0	0	1000	0	0	0	0	0	0	0	0	0	0
R12	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R13	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R14	0	0	0	0	0	0	0	0	0	0	0	0	0	0

- **NOW THE CONFLICTS ARE IN R3, R7, R8, R9 AFTER CAREFUL NEGOTIATIONS WE DECIDED TO CHANGE THE R9 TO THE REQUIREMENT THAT**

  “The current solution requires each department to manually submit their reports and update the system manually too, which introduces delays in data transfer, retrieval and even cause delay in critical information transfer and at the very same time the un-coordination among the departments arise because of this which makes integration an ideal solution.**”**

TO THIS:

“The current solution requires each department to manually submit their reports and update the system manually too, which introduces delays in data transfer, retrieval and even cause delay in critical information transfer and at the very same time the un- coordination among the departments arise because of this which makes integration as well as reluctance to change both an important things to consider as problems.**”**

- **NOW THE CONFLICTS ARE IN R3, R7, R8, R9 AFTER CAREFUL NEGOTIATIONS WE DECIDED TO CHANGE THE R9 TO THE REQUIREMENT THAT**

Now out of R2 and R10 after negotiations of course R2 chosen, similarly R3 and R4 are chose which makes the matrix now:

So now the requirements have lessen to

VISION DOCUMENT

1. Introduction

Purpose:

The document is an outline of the new system designed for NAB, which outlines objectives, requirements, and functionality expected from the project. The primary objective is to assist the developers, stakeholders, and users throughout the development process.

Scope:

The system will handle processes in order to meet the requirements of NAB's purposes, target population, fundamental functions, enhance data reliability, security, and efficient access.

Audience:

This note is to stakeholders who design, build, use, or service the project.

2. User Definition

User Types and Profiles:

Administrative Users: Responsible for system administration, user access, and general data;

End-Users: These are users who use the system to view, enter, and edit information regarding the case or other records;

Technical Support Team: Responsible for technical support, system maintenance, or flaws, and updates;

External Users: Users with a limited degree of access, but can include partners of the organization.

User Needs:

- Real-time data access and reporting
- Role-based data assurance, security, and management

- Logical easy usage system

3. Product Overview

Product Perspective:

This system is intended to integrate well with other organizational tools such as Database, Legacy Systems, etc. This system is compatible with the current infrastructure of the organization while it is also scalable for its future use.

Product Position Statement:

A total system ensuring case and record management is efficient, safe, and accurate; it ensures that modern security and compliance standards are realized.

4. Feature Attributes

Usability: It should be user-friendly, and therefore, the steepness of the learning curve should be minimized.

Security: Availability of role-based access and data encryption to ensure that data is secure.

Scalability: It should be scalable enough to accommodate a large volume of cases, users, and data because the needs of the organization are constantly growing.

Reliability: As available as possible with low chances of encountering downtime.

5. Product Features

•User Authentication and Authorization: Secure login and role-based access controls.

•Data Management Module: Efficient data input, updating, and retrieval system.

•Report Generation: Capability to generate reports according to user needs.

•Integration with Other Systems: APIs and data sharing ability with other systems.

•Data Analytics (Optional): Basic analytics giving insights and tracking case progress.

•Audit Logging: Tracks every action performed by the user for compliance and traceability.

6. Exemplary Use Cases

Use Case 1: Case Entry and Management

• **Actors:** End-User, Administrative User

• **Preconditions:** An authorized user is logged in.

• **Steps:**

1.User chooses the "New Case" option.

2. Inputs case details.

3. The system checks for its correctness and saves the input.

4. System indicates that the case is created.

•**Post conditions:** Case details are saved and available for retrieval.

Use Case 2: Report Generation

• **Actors:** End-User

• **Preconditions:** An authorized user is logged in.

• **Steps:**

1. User clicks on the "Generate Report".

2. It selects the type of report, start and end dates along with any filters.

3. The system generates the report and makes it available.

•**Post conditions**: The report is generated and readable by the user.

7. More Product Requirements

Operational Requirements:

Accessible during office hours as well as on demand for high-priority cases.

Performance Requirements:

Must respond within 2 seconds for major operations like case retrieval and reporting.

Security Requirements:

Role-based access control and encryption of sensitive data, secure API calls.

Compliance Requirements:

MUST comply with the applicable data privacy regulations at local and organizational levels.

8. Documentation Requirements

User Manual: It should include a comprehensive user manual that describes all features as well as its functions.

Technical Documentation: Information that is given to developers and system administrators must include a description of the system architecture, database schema, and codebase.

•• **Release Notes:** Version changes, new features and bugs.

•• **Training Materials:** Quick starts, video tutorials, FAQs for users.

9. Glossary

•• **API**: Application Programming Interface allows for data exchanges between systems.

•• **Role-Based Access Control (RBAC):** Access control based on the roles within the organization.

•• **Audit Log**: Records of user actions, used in tracking modification and accountability.
